Model

EWMA Version

Connections and future

Talk is based on 3 Papers

- Risk Appetite and Endogenous Risk, http://risk.lse.ac.uk/rr/files/JD-HS-JZ-34.pdf
- Modelling Financial Turmoil Through Endogenous Risk, http://www.voxeu.org/index.php?q=node/3243
- Endogenous Risk and Price Dynamics (in progress)

Model

EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Large price movements

- Exogenous single event e.g. macro announcement
- Endogenous responses
 - Perhaps speculative price buildup
 - Followed by rapid price drops
 - "Up the stairs down the elevator"
- Commentators say "risk aversion went up"
- But risk aversion is preference parameter

EWMA Version

Connections and future

- How can (apparent) preferences and beliefs be linked?
- ... through *constraints* faced by traders
- Value-at-Risk (VaR) constraints bind harder in more volatile conditions
- Past outcomes influence both
 - (i) how tight constraints bind (apparent preferences) and
 - (ii) current forecasts of future outcomes
- Upshot is that traders appear to become more risk averse when faced with greater uncertainty
- Then there is potential for feedback

Connections and future

Keynesian beauty contest

"It is not a case of choosing those [faces] which, to the best of ones judgement, are really the prettiest, nor even those which average opinion genuinely thinks the prettiest. We have reached the third degree where we devote our intelligences to anticipating what average opinion expects the average opinion to be. And there are some, I believe, who practice the fourth, fifth and higher degrees."

Keynes, General Theory of Employment Interest and Money, 1936.

EWMA Version

Connections and future

Endogenous risks vs. Exogenous risks

- *Endogenous risk*: the risk from shocks that are generated and amplified *within* the system
- *Exogenous risk*: shocks that arrive from *outside* the system
- Analogies
 - A financial hedge (futures contract) vs. a weather hedge (umbrella)
 - Poker vs. Roulette
- Essentially situations where an agent affects outcomes vs.

situations where the agent cannot

Millennium Bridge

- First new Thames crossing for over a hundred years
 - New design, extensive tests, riskless
 - Opened by the Queen on June 10th 2000
- What happened?

Model

EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Millennium Bridge

- First new Thames crossing for over a hundred years
 - New design, extensive tests, riskless
 - Opened by the Queen on June 10th 2000
- What happened?
 - · Wobbled violently within moments of bridge opening
 - Remain closed for the next 18 months

Model

EWMA Version

Connections and future

Millennium Bridge

- New design
- Tested with extensive simulations
- All angles covered
- No endogenous shocks
- Riskless

Model

EWMA Version

Connections and future

What Endogeneity?

- Pedestrians had some problems
- Bridge closed

Model

EWMA Version

Connections and future

What happened?

 Took the engineers some time time to discover what happened

Model

EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

What went wrong?

- An engineering answer
 - Cause: horizontal vibrations at 1 hertz
 - Walking pace: 2 steps per second, i.e. 2hertz
 - Producing 1 hertz horizonal force
- Why should it matter?
 - People's sway to the left and right cancel out each other
 - Only a problem when people walked in step
 - Probability of a thousand people walking at random ending up walking exactly in step? *close to zero*
 - If individual steps are independent events, but...

Connections and future

Given feedback...near certainty!

Further adjust stance

 EWMA Version

Connections and future

Model

 EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Endogeneity of Risk

- True risks impacting financial markets are attributable (at least in part) to actions of market participants.
- Endogenous risk is fixed point of mapping:

perceived risk \Rightarrow actual risk

- Solve for *stochastic volatility* function *σ*(*V*) in closed form, where
 - *V* is *capital* of active traders
 - Fundamental uncertainty is constant (iid)

 EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Some Themes

- Risk appetite \neq risk aversion
 - *Risk neutral* traders with *Value–at–Risk* (VaR) constraints
 - Risk appetite depends on how hard VaR constraint *binds*, i.e. on forecasts (beliefs) and trading capital
 - Lagrange multiplier enters like a risk aversion parameter
 - "As if" preferences shift with beliefs and losses/gains
- Distinction is more than semantic quibble
 - Risk-bearing capacity depends on recent outcomes (and seemingly evaporates during crises)
 - Crisis is not just about "jumps", but about *amplification* of distress

Model

EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

More Themes

- Endogenous correlation of returns
 - Returns on risky assets are correlated even though fundamental shocks are independent
- Financial regulation (e.g. Basel II) built on individually optimal risk management is flawed

Connections and future

 EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Model

- Two types of traders
 - Active traders (risk-neutral traders with VaR constraints)
 - Passive traders (residual demand/supply curves that close the model)

Solve for rational expectations equilibrium (REE) with respect to active traders' beliefs

Model

EWMA Version

Connections and future

Portfolio Choice of Active Traders

maximization problem is

 $\max_{D_t} rV_t + D_t^{\top}(\mu_t - r) \qquad \text{subject to} \qquad \alpha \sqrt{D_t^{\top} \sigma_t \sigma_t^{\top} D_t} \le V_t$

First-order condition

$$\mu_t - \mathbf{r} = \alpha (D_t^\top \Sigma_t D_t)^{-1/2} \gamma_t \Sigma_t D_t$$

where γ_t is Lagrange multiplier for VaR constraint,

Model 0000000000000 EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

"As if" Preferences

Optimal portfolio is similar to mean-variance optimal portfolio where the Lagrange multiplier γ_t appears like a risk-aversion coefficient and is

- proportional to generalized Sharpe ratio $\sqrt{\xi}$
- does not depend directly on equity V_t

Interpretation. Additional unit of capital relaxes VaR constraint by multiple α of standard deviation, raising expected return by risk-premium on the portfolio per unit of standard deviation

Paper with EWMA

- Before, REE was used to get the mean and covariance forecasts
- Here we want to use more heuristic methods for now EWMA
- Has many advantages because of its flexibility

EWMA Version

 $\begin{array}{c} \text{Connections and future} \\ \circ \circ \end{array}$

Questions and Research direction

- Contagion
 - From one asset to another (e.g. correlations)
 - From one institution to another
- Minsky moments history-dependence
 - Long period of stability creates conditions for instability
- Under what market conditions does speculative trading increase/decrease market stability
- Is harmonization (and higher quality) of risk management systems beneficial competing risk systems
- Estimation

its still early days for this research dirrection

Model

EWMA Version

Connections and future

Setup

maximization problem

 $\max_{D_t} rV_t + D_t^{\top}(\mu_t - r) \qquad \text{subject to} \qquad \alpha \sqrt{D_t^{\top} \Sigma_t^{\top} D_t} \le V_t$

evolution of wealth

$$dV_t = V_{t+1} - V_t = \left[rV_t + D_t^\top (\mu_t - r) \right] + D_t^\top \sigma_t dW_t$$

budget constraint

$$V_t = b_{t-1}B_t + \sum_i heta_{t-1}^i P_t^i$$

Model

EWMA Version

Connections and future

Updating of beliefs

• At the moment we just do EWMA

$$\mu_t = \lambda^{\mu} \mu_{t-1} + (1 - \lambda^{\mu}) R_t$$

$$\Sigma_t = \lambda \Sigma_{t-1} + (1 - \lambda) R'_t R_t$$

- but this could be replaced with any equation.
- Allows us to explore alternative risk management systems
- and competition among risk management system

EWMA Version

Connections and future 00

Solve simultaneously

$$\begin{aligned} R_t^i &= \log\left(\frac{P_t^i}{P_{t-1}^i}\right) \\ \mu_t &= \lambda^\mu \mu_{t-1} + (1 - \lambda^\mu) R_t \\ \Sigma_t &= \lambda \Sigma_{t-1} + (1 - \lambda) R_t' R_t \\ \xi_t &= (\mu_t - r)^\top \Sigma_t^{-1} (\mu_t - r) \\ P_t^i &= \exp\left(\frac{V_t}{\alpha \delta^i \sqrt{\xi_t}} (\mu_t^i - r) + rt + \eta z_t^i\right) \\ V_t &= b_{t-1} B_t + \sum_i \theta_{t-1}^i P_t^i \end{aligned}$$

Model

EWMA Version

Connections and future

The price impact function

$$P_t^i = \exp\left(\frac{V_t}{\alpha\delta^i\sqrt{\xi_t}}(\mu_t^i - r) + rt + \eta z_t^i\right)$$

- z exogenous shocks (IID normal)
- α, δ the price impact parameters
- But is this the best function?
- It has some problems
